

DSEQ32 (aka yet another TR clone) is based on the classic TR drumsequencers

see [trsequencer](#) for more drumsequencer designs

Features

- 32 step 8 track drum seq, each step has trig/acc/roll
- one track can be used as note track for bass sequencing
- independant length/tempo divisor for each track, all can be synced to a master track
- 8 banks of 16 patterns
- patterns are saved on a bankstick
- settings are stored on internal eeprom
- song mode
- all functions can be executed while running
- forward/backward playing direction
- 24 PPQ resolution
- midi clock master/slave (maybe also taptempo)
- sysex functionality

Interface

- lcd: displaying (bpm pat trknr edited_par)
- 32 step buttons + stepleds, leds are dual color to display trig/acc
 - step edit behaviour: step off/trig/trig+acc
 - all functions are accessed with a stepkey + shift combination
 - pattern selection: stepkey + pattern button
 - track select/mute: stepkey + track button

- rotary encoder for bpm, also used for editing values
- Step button layout:
 - Track layer

trk button + track select: solo track track select + play button: manually trigger note

Progress

- first prototype
- new layout design
- ledmatrix/buttonmatrix finished (see matrix page)
- frontpanel finished/wired
- first take on controll surface handler (step, track and pattern handling)
- sequencer works, timing is not stable yet
- made a temporary case
- fixed flickering leds when pushing a button
- bankstick error handling added
- default pattern is loaded when no BS is available at startup
- independant length/divider for each track implemented
- LCD optimisations
- loading and saving of patterns works now
- backward playing direction implemented

- midi mode implemented with simple slave mode (no interpolation)
- improved bpm handling (pattern bpm is saved with pattern)
- fill function implemented
- CS interface improved (the edit functions are now accessed with stepbutton+shift)
- settings are saved in internal eeprom
- notetrack implemented, this track will be used to program basslines
- changed data structure, new pattern is 256bytes
- cs is updated for notetrack (shift + track selects notetrack)
- shift + stop resets the song position
- due to code/ram space limitations the project is ported to a pic18f4620
- the core board was modified so that the backlight can be controlled by the software
- new bankstick routines to handle the larger pattern size
- 2 new functions added: Seq Reset and Backlight mode
- CC layer added
- tracks don't go out of sync after changing divisor
- the note track now has a note length parameter
- pattern banks are implemented
- new function: shift track
- the note-on status of tracks is displayed in the track layer
- note-off handling when seq is stopped added
- the pattern bpm is now loaded when the seq is not running
- 0.7e
 - pattern banks implemented, bug fixed in bankstick routines
 - manual trigger and solo implemented
 - basic sysex support
 - songmode now works
 - note length implementation for note track
 - it is now possible to sync pattern changes to begin of pattern
 - lots of core tick optimisations
 - obsolete functions removed

Software

Most of the code is written in C

the software will be based on the midibox [clockbox example](#) ^{uCApps}

- [Data structure](#)
- Application code
 - [Bankstick](#) (updated)
 - [Control surface](#)
 - [Sequencer core](#)
 - [Sequencer get/set and helper routines](#)
- you can find DSEQ32 v0.7e [here](#)
- the [doxygen](#) generated documentation is available [here](#)

Hardware

Components:

- CORE module [CORE Module](#) uCApps
- DOUTX3 [DOUT Module](#) uCApps
- DINX1 [DIN Module](#) uCApps
- BANKSTICK [BANKSTICK Module](#) uCApps

The leds/buttons are wired in a matrix configuration to reduce the number of DIN/DOUT modules needed [DSEQ32_matrix](#)

Construction

- Assembly of frontpanel

- Painting the case

- Assembly after painting

- Finished hardware

Development

First prototype:

[forum topic](#)

used for development of data structure, bankstick code, sequencer core

New version:

- Construction of frontpanel
- Wiring of the 32 step leds/buttons
- Testing of the step buttons with the SM_example application
- Testing of the step leds with modified SM_example app (modified version includes leddriver)
- Development of user interface code
- Button and led handling finished
- The flickering led problem is solved with MIOS v 1.9c
- Encoder handling works, but there's still a small bug
- Updated LCD layout for new functions
- The leds to indicate play/save/vel/special function button work now
- Some LCD optimisations
- Development of seq code
- Sequencer edit functions work as expected
- Sequencer runs!
- Fixed sequencer mute track bug
- Some tracks didn't send the note off messages correctly, corrected
- Bankstick error handling added
- Default pattern is loaded when no BS is available at startup
- Note length/divider is implemented
- Independant length/divider for each track
